Analysis: With R and Financial ... - We consider a random variable x and a data set $S = \{x_1, x_2, \hat{\epsilon}, x_n\}$ of size n which contains possible values of x . The data set can represent either the population being studied or a sample drawn from the population. Looking at S as representing a distribution, the skewness of S is a measure of symmetry while kurtosis is a measure of peakedness of the data in S .
